
Has MonoKote changed over the years? I have a few rolls of covering that say "Super MonoKote" on the wrapper and newer rolls that say "MonoKote". What is the difference?

No major changes have been made to the formulation in the past 15 years. That is not to say that slight changes are not made from time to time to conform to constantly changing EPA regulations. This is primarily concerning solvents, the adhesive/pigment package has remained virtually unchanged since the upgrade to "Super MonoKote" . With this in mind please be aware that not all colors are made exactly the same-some colors adhere better than others, some offer more opacity and so on. But they all have essentially the same characteristics.

Concerning the change from MonoKote to Super MonoKote and back to MonoKote. The original material sold was "MonoKote" this was only on the market for about 5-6 years before it was upgraded to "Super MonoKote". It has remained Super MonoKote ever since. We stopped using the "Super" designation (but changed nothing in the formulation) because most of the modelers involved in the hobby today do not remember the original MonoKote. This created some confusion with some modelers wondering about "regular" MonoKote.

As a final thought, you will note that we did not change the "Super" designation on the roll itself. The imprint of "Super MonoKote" is still stamped on the edge of every roll.
